We are currently updating the OP Help Center content for the release of OP 14.19 or OP 19. OP 19 is a member of the certified OP 14 family of products (official version is 14.19.1), which you may see in your software (such as in Help > About) and in the Help Center tabs labeled 14.19. You may also notice that the version number in content and videos may not match the version of your software, and some procedural content may not match the workflow in your software. We appreciate your patience and understanding as we make these enhancements.

Why are units not populating from Medication Favorites?

Last Modified on 09/30/2019 11:18 am EDT

OP has updated the list for units to reflect the current Surescripts defined values. Older values have been removed from the unit list. See below for the accepted units. The practice will need to update medication favorites that have been saved using a unit value no longer available. For instruction on how to edit medication favorites, click **here** .
