

# VacLogic+ Release Updates: Version 1.6

Last Modified on 10/16/2024 8:51 pm EDT

## VacLogic+ Maintenance Release 1.6.0 | All Practices: September 12, 2024

### Forecasting Revisions

Based on FDA / CDC guidelines, this version of VacLogic+ forecasting has been revised to accurately reflect the following recommendations:

#### PENBRAYA / Meningitis B

- Added new logic to reflect administration of PENBRAYA, the new MenACWY - Men B vaccine to forecast appropriately for both Meningitis ACWY as well as Meningitis B schedules, according to CDC/ACIP guidelines for its use.
- Updated Meningitis B forecasting will account for a new UI design change added in **21.3.64** to reflect the choices of:
  - Meningitis B not forecast (default)
  - Meningitis B Shared Decision Making (Forecasting will start at age 16)
  - Meningitis B high risk (Forecasting starts at age 10)
- **PLEASE NOTE:** the forecasting specifically for PENBRAYA will require that practices are running **OP 21.3.64**. Earlier versions will incorrectly display a documented dose of PENBRAYA
